1 Week 3 Assignment

1.1 Problem 1

In the cell below, import the math module and use it to compute $\sqrt{\pi}$

```
[3]: import math

math.sqrt(math.pi)
```

```
[3]: 1.7724538509055159
```

1.2 Problem 2

In the cell below, import the randint function from the random module and use it to simulate rolling a six-sided die. Print the result.

```
[4]: from random import randint

randint(1,6)
```

```
[4]: 2
```

1.3 Problem 3

Scroll through the packages on the pypi.org index and find one that looks interesting to you. In the cell below, describe the package and what it is used for.

```
[ ]: #imports python jokes
import pyjokes

# prints by calling the function python jokes, structure get_joke
print(pyjokes.get_joke())
```

Why do they call this a word processor? It's simple, ... you've seen what food processors do to food, right?

1.4 Problem 4

In the cell below use the Faker package to generate and print three fake sentences.

```
[ ]: from faker import Faker
fake = Faker()

print(fake.sentence())
print(fake.sentence())
print(fake.sentence())
```

Enough meeting policy general support health.
Want seat learn simply type market soldier.
Television thus machine pattern against up.

1.5 Problem 5

The cells below contain code that generates errors when run. Write a brief description of the problem and modify the code so that the cells execute properly.

```
[ ]: # 3(4+5) is totally acceptable in the world of mathematics
# in this case it's not specific enough or even written properly when it comes
↳ to python
# thus defaulting in a error

3*(4+5)
```

```
[ ]: 27
```

```
[ ]: # these 2 are not read as the same thing 1 and '1' for an example are different.
# 1 is read as an integer in which is used to calculate and '1' will be read as
↳ a string of 1

1 + 2
```

```
[ ]: 3
```

```
[ ]: # when working with math we must import the math library
# in addition, we must add the word math in front of the function
# this is very similar to a struct in C
import math

math.cos(1)
```

```
[ ]: 0.5403023058681398
```
